<u>DECLARATION</u>

I do hereby declare that the project work entitled **PRISON SYSTEM** Submitted to the Bengaluru North University in the partial fulfillment of the requirements for the award of degree of Bachelor of Computer Applications is a record of confide and independent project work carried out by ourself under guidance and supervision of **MR.LOGANAYAGAN V** (Assistant professor, Department of BCA) and this report does not form any part previous dissertations or report previously submitted to this University or any other universities for the award of degree or diploma.

SURYA V

[R1918102]

ACKNOWLEDGEMENT

We take this opportunity to express our deep sense of gratitude to our founder chairman **Dr. VENKATAPATHI S.M.**

We express our sincere thanks to our respected principal **Dr. VIJAYA BHASKARAN** and , coordinator of BCA Department for providing all necessary help during our project work.

We also express our sincere thanks to our project guide **MR.LOGANAYAGAN V**(assistant professor)**,** Department of BCA for valuable guidance keen interest and helpful during this project.

Also, we would like to thank our Head of department **Dr.PERIYASAMY**, for his guidance throughout the project

We also,thank our staffs and friends and all other who have directly and indirectly helped us in the successful completion of this project.

SURYA V

[R1918102

INDEX

INTRODUCTION

My project title is prison system. I have tried my best to make the complicated process of prison System as simple as possible using java and my sql . I have tried to design the Project in such a way that user may not have any difficulty in using this package & further expansion is possible without much effort. Even though I cannot claim that this work to be entirely exhaustive, the main purpose of my exercise is perform each citizen activity in computerized way rather than manually which is time consuming I am confident that this software package can be readily used by non-programming personal avoiding human handled chance of error.

This system is made to keep records about the prisoners and about the crimes. Jailor can log in as a user and can add the details of prisoners like name, age, crime, and punishment. This system gives a unique id to every FIR as required and the prisoner number will also be unique.

This system has one more user which is admin. Admin can add the user and delete the user. All other attributes can only be changed by the user. This system talks about any crime that is done and if any complaint is made to the police or if any fir is done and if the criminal gets caught and we can update the information about the case and one other benefit is that if the complaint is registered online then it can be checked by all the registered users and if there is any update about any complaint then it can be added online.

It increases the efficiency of the police to caught criminals. The prison system can be implemented in every prison without any problem. This system has the capability to maintain an infinite number of records. It is very useful as the written papers have a limited time period and can get lost but in the crime management, this is not possible as a backup file will be created automatically and also updated automatically when any change is made in any record.

Managing the prisoner record and monitoring of prisoner / visitor was always difficult since most of the records were normally maintained manually, so the concerned authorities were required to go through all the registers to find out the details and status of the inmate as well as of the visitor.Using prison management system it will easy to maintain all the details about the prisoners.

citizen can verify and add users but cannot see the complaints that are saved by users in the database because these files must be kept secret and only the required person could check the files. Some other features are criminals' details, checking records, registering users, etc. Moving on Further we will see the designing of the system and attributes of it on the principles of which our system does work properly.

ABSTRACT

The system aims at the maintenance and management of different crime that are available in different places. It mainly takes care of the crime and prison management at the core of the database.The system provides the information regarding the different crimes and prisoners that are available and their status. The citizen can visit the project and first register and then can file case as many as he need at the desired place.

The total front end was developed using jsp. At all proper levels high care was taken to check that the system manages the consistency with the proper database connectivity, the authorization was cross checked at all stages and the entire backend to store the data was designed in MySQL..

This project will have many different pages with an inbuilt authentication (username and password).This project will contain many text boxes, labes boxes,and also many comman buttons etc.

Further the details of each and every process and the user manuals are attached to make the software and report clear, simple, and error free which makes it so special and one of its kind.

OBJECTIVE

During the past several decades personnel function has been transformed from a relatively obscure record keeping staff to central and top level management function. There are many factors that have influenced this transformation like technological advances, professionalism, and general recognition of human beings as most important resources.

- ➢ A computer based management system is designed to handle all the primary informations.

- ➢ It helps to maintain to handle all the details required for the correct statement calculation and generation.

- ➢ This project intends to introduce more user friendliness in the various activities such as record updation, maintenance, and searching.

- ➢ The searching of record has been made quite simple as all the details of the customer can be obtained by simply keying in to the datatables of our project.

- ➢ Similarly, record maintenance and updation can also be accomplished by using the identification of the customer with all the details being automatically generated. These details are also being promptly automatically updated in the master file thus keeping the record absolutely up-to-date.

- ➢ The entire information has maintained in the database or Files and whoever wants to retrieve can't retrieve, only authorization user can retrieve the necessary information which can be easily be accessible from the file.

The main objective of the entire activity is to automate the process of day to day.

activities of prison system like:

- Admission of a New Citizen.
- Citizen sign in.
- File a case according to citizen's demand,
- Unique FIR id for each person.
- Updating FIR according to the status.
- Adding prisoners.

SCOPE OF THE PROJECT

I have designed the given proposed system in the JAVA to automate the process of prison system. This project is useful for the authorities which keep track of all the crime registered in a particular place .The authority can add prisoner, cell no details, unique FIR id etc.

The following steps that give the detailed information of the need of proposed system are:

Performance: During past several decades, the records are supposed to be manually handled for all activities. The manual handling of the record is time consuming and highly prone to error.

To improve the performance of the prison System, the computerized system is to be undertaken. This project is fully computerized and user friendly even that any of the members can see the report.

Efficiency: The basic need of this project is efficiency. The project should be efficient so that whenever a new citizen submits his/her details the record of the citizen is updated automatically. This record will be useful for other users instantly.

Control: The complete control of the project is under the hands of authorized person who has the password to access this project and illegal access is not supposed to deal with. All the control is under the administrator and the other members have the rights to just see the records not to change any transaction or entry.

Security: Security is the main criteria for the proposed system. Since illegal access may corrupt the database. So security has to be given in this project.

MODULES

This system has two main interfaces one for the admin panel and the other is for the citizen panel.

Along with these, we have other interfaces which can be discussed as below:

Citizen registration:

Citizens need to be registered in the prison management system so as to use the system and add the criminals' details, add complaints, update closed cases, etc. If the user is not registered in the prison management system, he/she cannot do any task with it like writing FIRs, adding prisoner crime and punishment details, etc.

Citizen Login:

After registration one can log in to the system as the operator of the system on the behalf of the user. After this, he has the other user interfaces available for further actions.

Admin login:

This modue maintains the information regarding the case booked by specific member at the specific location.the admin can login with the username and the password and can look it the details about the crime details using the system

The admin login page consists of two blocks which must be submiited by the admin so that he can enter into the system .First, the username which will be 'admin' and then the password of his wish, after submitting all the required detilas by the admin he can view the specified results of the prison system the admin module is connected to the database in the backend ,so all the details entered in the page will be updated in the MySQL data tables .

After the admin login many features are available like add crime data, missing person, fir ,update fir and profile etc

FIR:

This option is provided in the prison management system is writing FIR. We all know FIR is First Information Report. All FIRs have unique complaint numbers, Dates, Times, and locations. A similar interface is provided for writing FIR in this system. FIR written cannot be lost and fast actions can be taken on the basis of it as it will be uploaded on server and others can see it.

In this system, FIR has all the options that are in the old handwritten system but is more secure as no changes can be made once the FIR is submitted and only the authorized users can see it.

FILE COMPLAINT:

This option that is given in this is one of the most important that is file complaint. the crime can be updated in the prison system.

Then later these details can be used further and there is no option to delete the prisoner's data so once the prisoner is added to the database, no one can delete the data of the criminal and it will be helpful as papers can get lost or can be theft but, in this case, information cannot be lost and there is no use of theft this data as no changes can be made in the database.

Prisoners' data cannot be lost because the backup of the database is there and the backup gets updated as soon as the changes are made into the database. module is connected to the database in the backend ,so all the details entered in the page will be updated in the MySQL datatables

VIEW FILED COMPLAINTS:

This important feature that is provided by this system is view filed complaints. In this module citizen can view his filed complaint and status of the case like case in progress or case is completed. Citizen can see the details like id, date of case booked, booked for ,email, gender etc. module is connected to the database in the backend ,so all the details entered in the page will be updated in the MySQL datatables.

SYSTEM REQUIREMENTS

HARDWARE REQUIREMENTS:

The minimum requirements to implement the project are as follows:

1. System : Pentium IV 2.4 GHz Onwards.
2. Hard Disk : 40 GB Onwards
3. Floppy Drive : 44 Mb Onwards.
4. Monitor : 15 VGA Colour.
5. Mouse : any
6. Keyboard : standard windows keyboard
7. Ram : 512 Mb Onwards.

SOFTWARE REQUIREMENTS:

The minimum requirements to implement the project are as follows:

1. Operating system : Windows XP/7 Onwards.
2. Coding Language : JAVA/J2EE
3. IDE : Netbeans 7.4
4. Database : MYSQL

JAVA TECHNOLOGIES USED

Technologies Used:

1. JSP as front end.
2. MYSQL as Back end

Software Used:

1. Windows 10.
2. Netbeans IDE.
3. My SQL

Hardware Requirements:

1. Processor – Pentium IV or higher version.
2. Ram – 4GB onwards
3. Hard Disk – 100 GB Onwards

JSP Literature

What is JavaServer Pages?

JavaServer Pages (JSP) is a technology for developing web pages that support dynamic content which helps developers insert java code in HTML pages by making use of special JSP tags, most of which start with <% and end with %>.

A JavaServer Pages component is a type of Java servlet that is designed to fulfill the role of a user interface for a Java web application. Web developers write JSPs as text files that combine HTML or XHTML code, XML elements, and embedded JSP actions and commands.

Using JSP, you can collect input from users through web page forms, present records from a database or another source, and create web pages dynamically.

JSP tags can be used for a variety of purposes, such as retrieving information from a database or registering user preferences, accessing JavaBeans components, passing control between pages and sharing information between requests, pages etc.

Why Use JSP?

JavaServer Pages often serve the same purpose as programs implemented using the Common Gateway Interface (CGI). But JSP offer several advantages in comparison with the CGI.

- Performance is significantly better because JSP allows embedding Dynamic Elements in HTML Pages itself instead of having a separate CGI files.

- JSP are always compiled before it's processed by the server unlike CGI/Perl which requires the server to load an interpreter and the target script each time the page is requested.

- JavaServer Pages are built on top of the Java Servlets API, so like Servlets, JSP also has access to all the powerful Enterprise Java APIs, including JDBC, JNDI, EJB, JAXP etc.

- JSP pages can be used in combination with servlets that handle the business logic, the model supported by Java servlet template engines.

Finally, JSP is an integral part of Java EE, a complete platform for enterprise class applications. This means that JSP can play a part in the simplest applications to the most complex and demanding.

Advantages of JSP:

Following is the list of other advantages of using JSP over other technologies:

- **vs. Active Server Pages (ASP):** The advantages of JSP are twofold. First, the dynamic part is written in Java, not Visual Basic or other MS specific language, so it is more powerful and easier to use. Second, it is portable to other operating systems and non-Microsoft Web servers.

- **vs. Pure Servlets:** It is more convenient to write (and to modify!) regular HTML than to have plenty of println statements that generate the HTML.

- **vs. Server-Side Includes (SSI):** SSI is really only intended for simple inclusions, not for "real" programs that use form data, make database connections, and the like.

- **vs. JavaScript:** JavaScript can generate HTML dynamically on the client but can hardly interact with the web server to perform complex tasks like database access and image processing etc.

- **vs. Static HTML:** Regular HTML, of course, cannot contain dynamic information.

The web server needs a JSP engine ie. container to process JSP pages. The JSP container is responsible for intercepting requests for JSP pages. This tutorial makes use of Apache which has built-in JSP container to support JSP pages development.

A JSP container works with the Web server to provide the runtime environment and other services a JSP needs. It knows how to understand the special elements that are part of JSPs.

Following diagram shows the position of JSP container and JSP files in a Web Application.

Typical Web server supporting JSP
JSP Processing:

The following steps explain how the web server creates the web page using JSP:

- As with a normal page, your browser sends an HTTP request to the web server.

- The web server recognizes that the HTTP request is for a JSP page and forwards it to a JSP engine. This is done by using the URL or JSP page which ends with **.jsp** instead of .html.

- The JSP engine loads the JSP page from disk and converts it into a servlet content. This conversion is very simple in which all template text is converted to println( ) statements and all JSP elements are converted to Java code that implements the corresponding dynamic behavior of the page.

- The JSP engine compiles the servlet into an executable class and forwards the original request to a servlet engine.

- A part of the web server called the servlet engine loads the Servlet class and executes it. During execution, the servlet produces an output in HTML format, which the servlet engine passes to the web server inside an HTTP response.

- The web server forwards the HTTP response to your browser in terms of static HTML content.

- Finally web browser handles the dynamically generated HTML page inside the HTTP response exactly as if it were a static page.

All the above mentioned steps can be shown below in the following diagram:
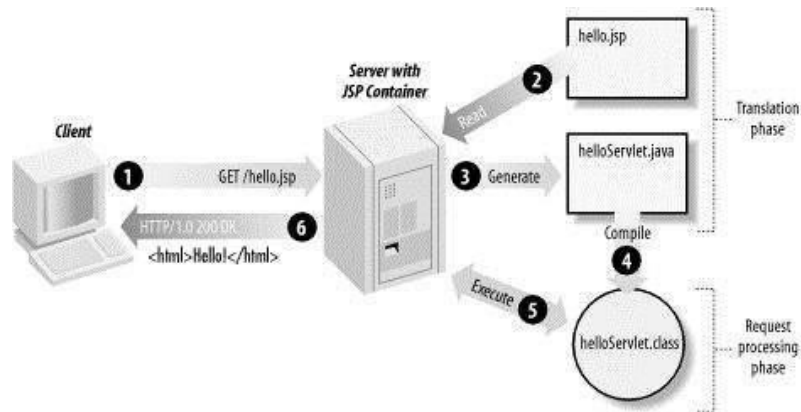

Typically, the JSP engine checks to see whether a servlet for a JSP file already exists and whether the modification date on the JSP is older than the servlet. If the JSP is older than its generated servlet, the JSP container assumes that the JSP hasn't changed and that the generated servlet still matches the JSP's contents. This makes the process more efficient than with other scripting languages (such as PHP) and therefore faster.

So in a way, a JSP page is really just another way to write a servlet without having to be a Java programming wiz. Except for the translation phase, a JSP page is handled exactly like a regular servlet.

OVERVIEW OF MYSQL

MySQL is the most popular Open Source Relational SQL database management system. MySQL is one of the best RDBMS being used for developing web-based software applications.

This tutorial will give you quick start with MySQL and make you comfortable with MySQL programming.

What is Database?

A database is a separate application that stores a collection of data. Each database has one or more distinct APIs for creating, accessing, managing, searching and replicating the data it holds.

Other kinds of data stores can be used, such as files on the file system or large hash tables in memory but data fetching and writing would not be so fast and easy with those types of systems.

So nowadays, we use relational database management systems (RDBMS) to store and manage huge volume of data. This is called relational database because all the data is stored into different tables and relations are established using primary keys or other keys known as foreign keys.

A **Relational DataBase Management System (RDBMS)** is a software that:

- Enables you to implement a database with tables, columns and indexes.

- Guarantees the Referential Integrity between rows of various tables.

- Updates the indexes automatically.

- Interprets an SQL query and combines information from various tables.

RDBMS Terminology:

Before we proceed to explain MySQL database system, let's revise few definitions related to database.

- **Database:** A database is a collection of tables, with related data.

- **Table:** A table is a matrix with data. A table in a database looks like a simple spreadsheet.

- **Column:** One column (data element) contains data of one and the same kind, for example the column postcode.

- **Row:** A row (= tuple, entry or record) is a group of related data, for example the data of one subscription.

- **Redundancy:** Storing data twice, redundantly to make the system faster.

- **Primary Key:** A primary key is unique. A key value can not occur twice in one table. With a key, you can find at most one row.

- **Foreign Key:** A foreign key is the linking pin between two tables.

- **Compound Key:** A compound key (composite key) is a key that consists of multiple columns, because one column is not sufficiently unique.

- **Index:** An index in a database resembles an index at the back of a book.

- **Referential Integrity:** Referential Integrity makes sure that a foreign key value always points to an existing row.

MySQL Database:

MySQL is a fast, easy-to-use RDBMS being used for many small and big businesses. MySQL is developed, marketed, and supported by MySQL AB, which is a Swedish company. MySQL is becoming so popular because of many good reasons:

- MySQL is released under an open-source license. So you have nothing to pay to use it.

- MySQL is a very powerful program in its own right. It handles a large subset of the functionality of the most expensive and powerful database packages.

- MySQL uses a standard form of the well-known SQL data language.

- MySQL works on many operating systems and with many languages including PHP, PERL, C, C++, JAVA, etc.

- MySQL works very quickly and works well even with large data sets.

- MySQL is very friendly to PHP, the most appreciated language for web development.

- MySQL supports large databases, up to 50 million rows or more in a table. The default file size limit for a table is 4GB, but you can increase this (if your operating system can handle it) to a theoretical limit of 8 million terabytes (TB).

- MySQL is customizable. The open-source GPL license allows programmers to modify the MySQL software to fit their own specific environments.

Properly defining the fields in a table is important to the overall optimization of your database. You should use only the type and size of field you really need to use; don't define a field as 10 characters wide if you know you're only going to use 2 characters. These types of fields (or columns) are also referred to as data types, after the **type of data** you will be storing in those fields.

MySQL uses many different data types broken into three categories: numeric, date and time, and string types.

Numeric Data Types:

MySQL uses all the standard ANSI SQL numeric data types, so if you're coming to MySQL from a different database system, these definitions will look familiar to you. The following list shows the common numeric data types and their descriptions:

- **INT** - A normal-sized integer that can be signed or unsigned. If signed, the allowable range is from -2147483648 to 2147483647. If unsigned, the allowable range is from 0 to 4294967295. You can specify a width of up to 11 digits.

- **TINYINT** - A very small integer that can be signed or unsigned. If signed, the allowable range is from -128 to 127. If unsigned, the allowable range is from 0 to 255. You can specify a width of up to 4 digits.

- **SMALLINT** - A small integer that can be signed or unsigned. If signed, the allowable range is from -32768 to 32767. If unsigned, the allowable range is from 0 to 65535. You can specify a width of up to 5 digits.

- **MEDIUMINT** - A medium-sized integer that can be signed or unsigned. If signed, the allowable range is from -8388608 to 8388607. If unsigned, the allowable range is from 0 to 16777215. You can specify a width of up to 9 digits.

- **BIGINT** - A large integer that can be signed or unsigned. If signed, the allowable range is from -9223372036854775808 to 9223372036854775807. If unsigned, the allowable range is from 0 to 18446744073709551615. You can specify a width of up to 20 digits.

- **FLOAT(M,D)** - A floating-point number that cannot be unsigned. You can define the display length (M) and the number of decimals (D). This is not required and will

default to 10,2, where 2 is the number of decimals and 10 is the total number of digits (including decimals). Decimal precision can go to 24 places for a FLOAT.

- **DOUBLE(M,D)** - A double precision floating-point number that cannot be unsigned. You can define the display length (M) and the number of decimals (D). This is not required and will default to 16,4, where 4 is the number of decimals. Decimal precision can go to 53 places for a DOUBLE. REAL is a synonym for DOUBLE.

- **DECIMAL(M,D)** - An unpacked floating-point number that cannot be unsigned. In unpacked decimals, each decimal corresponds to one byte. Defining the display length (M) and the number of decimals (D) is required. NUMERIC is a synonym for DECIMAL.

Date and Time Types:

The MySQL date and time datatypes are:

- **DATE** - A date in YYYY-MM-DD format, between 1000-01-01 and 9999-12-31. For example, December 30th, 1973 would be stored as 1973-12-30.

- **DATETIME** - A date and time combination in YYYY-MM-DD HH:MM:SS format, between 1000-01-01 00:00:00 and 9999-12-31 23:59:59. For example, 3:30 in the afternoon on December 30th, 1973 would be stored as 1973-12-30 15:30:00.

- **TIMESTAMP** - A timestamp between midnight, January 1, 1970 and sometime in 2037. This looks like the previous DATETIME format, only without the hyphens between numbers; 3:30 in the afternoon on December 30th, 1973 would be stored as 19731230153000 (YYYYMMDDHHMMSS).

- **TIME** - Stores the time in HH:MM:SS format.

- **YEAR(M)** - Stores a year in 2-digit or 4-digit format. If the length is specified as 2 (for example YEAR(2)), YEAR can be 1970 to 2069 (70 to 69). If the length is specified as 4, YEAR can be 1901 to 2155. The default length is 4.

String Types:

Although numeric and date types are fun, most data you'll store will be in string format. This list describes the common string datatypes in MySQL.

- **CHAR(M)** - A fixed-length string between 1 and 255 characters in length (for example CHAR(5)), right-padded with spaces to the specified length when stored. Defining a length is not required, but the default is 1.

- **VARCHAR(M)** - A variable-length string between 1 and 255 characters in length; for example VARCHAR(25). You must define a length when creating a VARCHAR field.

- **BLOB or TEXT** - A field with a maximum length of 65535 characters. BLOBs are "Binary Large Objects" and are used to store large amounts of binary data, such as images or other types of files. Fields defined as TEXT also hold large amounts of data; the difference between the two is that sorts and comparisons on stored data are case sensitive on BLOBs and are not case sensitive in TEXT fields. You do not specify a length with BLOB or TEXT.

- **TINYBLOB or TINYTEXT** - A BLOB or TEXT column with a maximum length of 255 characters. You do not specify a length with TINYBLOB or TINYTEXT.

- **MEDIUMBLOB or MEDIUMTEXT** - A BLOB or TEXT column with a maximum length of 16777215 characters. You do not specify a length with MEDIUMBLOB or MEDIUMTEXT.

- **LONGBLOB or LONGTEXT** - A BLOB or TEXT column with a maximum length of 4294967295 characters. You do not specify a length with LONGBLOB or LONGTEXT.

ENUM - An enumeration, which is a fancy term for list. When defining an ENUM, you are creating a list of items from which the value must be selected (or it can be NULL). For example, if you wanted your field to contain "A" or "B" or "C", you would define your ENUM as ENUM ('A', 'B', 'C') and only those values (or NULL) could ever populate that field.

FUNCTIONAL REQUIREMENTS

The functional requirements are those requirements that are necessary to the eye of the user and the client. Here we try to make the module possible to accomplish the need of the desired function.

Few of its functional requirements are as follows:

- **Add crime details**:-In this section, Admin add crime details to citizen(update status, profile , case details, length etc)

- **citizen**: citizen's need to file their cases in their portal to file a complaint and their required details,

    - Name

    - Booked for

    - Gender

    - Date of booking

    - Case booked by

    - Case registered at

    - Photo

    - Email id

- **Edit password**: It is used to reset the password

NON-FUNCTIONAL REQUIREMENTS

Non-functional Requirements define system attributes such as security, reliability, performance, maintainability, scalability, and usability. They serve as constraints or restrictions on the design of the system across the different backlogs.

Few of its Non-functional requirements are as follows:

Speed

Speed determines how fast an application responds to commands. For example, if you type a word into a search engine, the speed of the engine determines how quickly you receive search results

Security

To protect sensitive data, you may consider developing non-functional security features. For example, professionals at healthcare facilities use secure databases to store patients' medical records.

Compatibility

Highly compatible systems typically function well when other applications are running on a device. Compatibility also allows people who have different operating systems to use the same applications.

Portability

Portability means how effectively a system performs in one environment compared to another. For example, a user might purchase a new cell phone model and download a mobile application they had on their last device.

Reliability

Technology that is highly reliable functions with the same or similar efficiency after extensive use. Here are three ways you can assess a device's reliability:

1. Number of critical failures

2. Percentage of the probability of failure

3. Time between critical failures

FEASIBILITY STUDY

The feasibility study proposes one or more feasible conceptual solutions to the problem set of the project. The conceptual solutions give an idea of what the new system will look like. They indicate what inputs are needed by the system and what outputs will be produced. Three things to be done to established feasibility. First, it must be checked that the project is technically feasible. Second, operational feasibility must be established. For this, it is necessary to consult the system users to see if the proposed solution satisfies user objectives and can be fitted in to current system operation. Third, economic feasibility must be checked. The study must determine whether the project 's goal can be achieved within the resource limits allocated to it. It must also determine whether it is worthwhile to proceed with the project at all or whether the benefits obtained from the new system are not worth the cost, in which case the project will be terminated.

Feasibility study is necessary to determine whether the proposed system is feasible considering the technical, operational and economic factors. By having detailed feasibility study one can have a clear view of the proposed system with respect to its benefits and draw backs. For a successful feasibility study of system feasibility, the existing systems and proposed system are studied carefully.

System Feasibility The feasibility study is carried out to determine whether the proposed system can be developed with the available resources.

- • Operational Feasibility

- • Technical Feasibility

- • Economic Feasibility

- • Motivational Feasibility

- • Schedule Feasibility

TECHNICAL FEASIBILITY

Technical feasibility is the study of resource availability that may affect the ability to achieve an acceptable system. Technical feasibility is the most difficult area to ensure at initial stages. Since the objectives functions and performance cannot be predicted to its fullest, everything seems possible provided proper assumptions are made. It is essential that the process of technical feasibility. The consideration that is normally associated with technical feasibility included resource availability at the organization where the project is to be developed and implemented.

ECONOMICAL FEASIBILITY

An evaluation of development cast weighted against the ultimate income or benefit derived from the developed system. Economical economic justification includes a broad range of concerns that include cost-benefit analysis. Cost benefit delineates costs for project development and weighs them against tangible and intangible benefits of a system. Regarding the cost and benefits, the project, which is to man-hours with compared to man that are required to record data about activity task report manually and also in terms of money benefits by the selling of this system as a product. Thus, this project work is economically feasible for the development in any company.

MOTIVATIONAL FEASIBILITY

An evaluation of the probability that the company is significantly motivated to support the development and implementation of the application with necessary user participation, resources, training etc. the participation and support by the organization during system study was encouraging thus eliminating any resistance in this regard. So, from behavioral aspect the new system is supposed to have efficient from the company.

SCHEDULE FEASIBILITY

The time schedule required for the development of this project is very important since over-runs result in escalated projects costs and also hinders in the development of the other systems.

OPERATIONAL FEASIBILITY

The project is going to be used by the organization under different circumstances. Anyone can work with this application as it supports user-friendly approach. It provides graphical user interfaces to the user, so that user can easily interact with the system. Users no need to have the knowledge about ASP. Net, MSSQL concepts to use the application. The application is designed in such a way that it can be easily implemented in any android version device or cell.

DATA FLOW DIAGRAM

A data-flow diagram is a way of responding a flow of data through a process or a system (usually an information system). The DFD also provides information about the outputs and inputs of each entity and the process itself. A data-flow diagram has no control flow, there are no decision rules and no loops. Specific operation based on the data can be represented by flowchart.

There are several notations for displaying data-flow diagrams. For each data-flow at least one of the endpoints (source and /or destination) must exit in a process. The refined representation of a process can be done in another data flow diagram. Which subdivides this process into sub processes.

The data-flow diagram is a part of the structured-analysis modelling tools. When using UML., the activity diagram typically takes over the role of the data-flow diagram. A special form of data-flow plan is a site-oriented data-flow plan.

DFD SYMBOLS:
Level-0
LEVEL-1
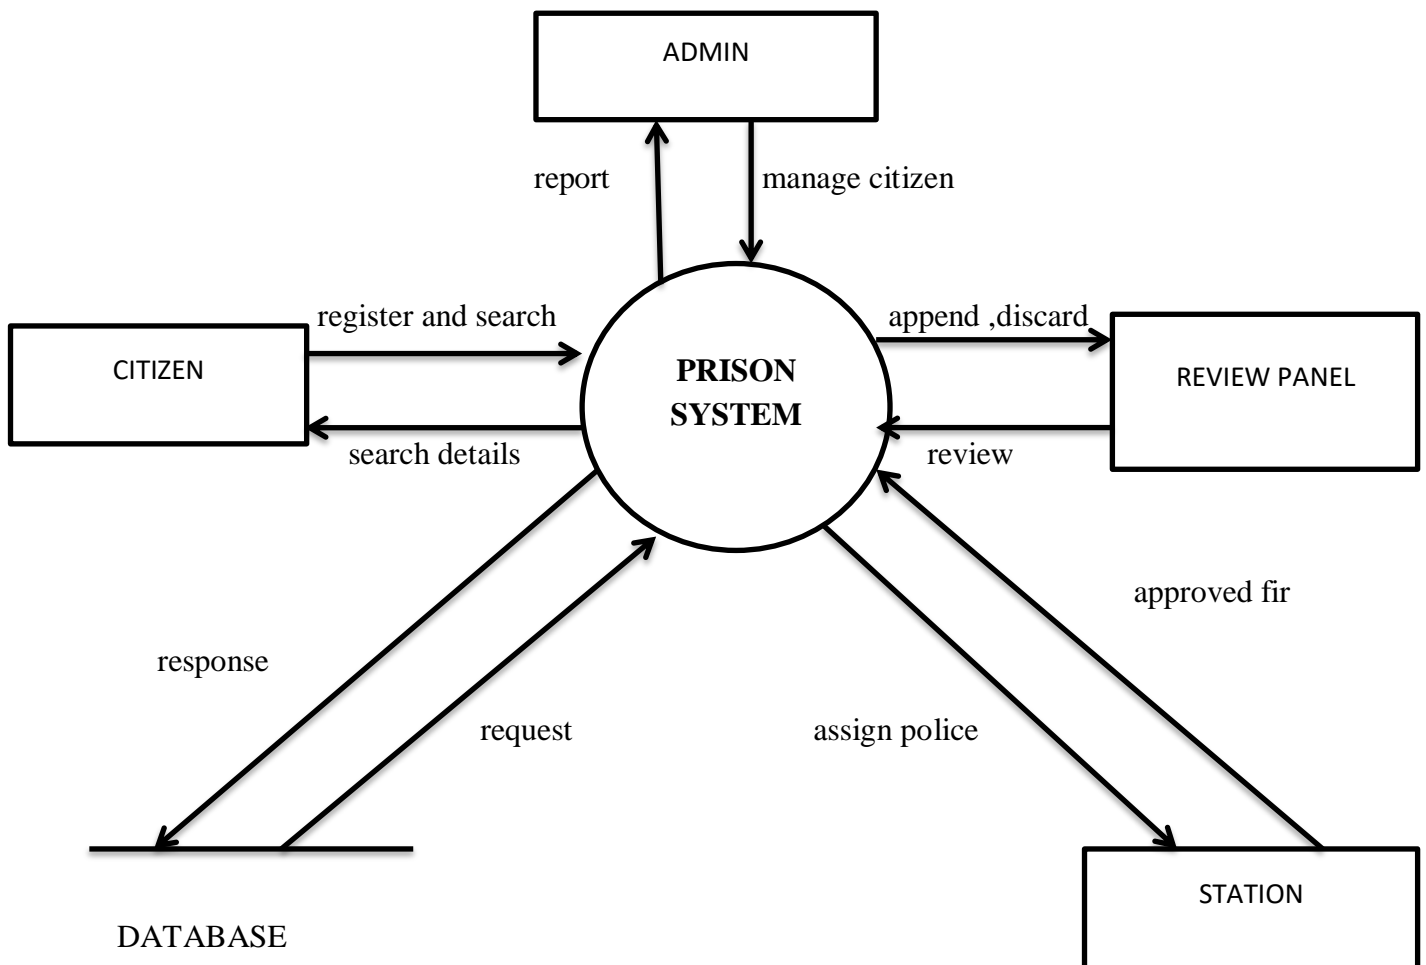

ER DIAGRAM

An entity-relationship model (or ER model) describes interrelated things of interest in a specific domain of knowledge. A basic ER model is composed of entity types (which classify the things of interest) and specifies relationships that can exist between entities (instances of those entity type).

In software engineering, an ER model is commonly formed to represent things a business needs to remember in order to perform business processes. Consequently, the ER model becomes an abstract model, that defines a data or information structure which can be implemented in a database, typically a relational database.

SYMBOLS USED IN ER DIAGRAM:

There are three basic elements in an ER diagram: entity, attribute, relationship. They are weak entity, multi valued attribute, derived attribute, weak relationship, and recursive relationship. Cardinality and ordinary are two other notations used in ER diagrams to further define relationships.

<p><strong>ABOUT US</strong></p>
<p> <strong> PRISON SYSTEM </strong> is a web based application which provides facility for reporting
online crimes such as complaints , most wanted criminal details etc. The main objective of this web based
application is to reduce manual work.. It satisfies the user requirements and it is user friendly. This web-based
application can be used by common people.This  project has a login page where in the user is required to enter
their Aadhar  number and register to the server. This project has a crime page where  registered police stations
are given respective username and password using  those details, they can login and enter data. </p>

2	Citizen login	User invalid details	Error message should be displayed	Error message displayed	pass

Conclusion & Future Enhancements

The Software developed is found to be working efficiently and effectively. It results inregular and timely action against crime reported. It can be observed that the information can beobtained easily and accurately.The Software is made user friendly to the maximum so that any lay man can run the software provided he could access to the system via the login password.It believes that partnership work is highly beneficial to the organization and that partnership work is the way forward to reduce crime and disorderHence, we wish to remind that its culture should fully endorse partnership work; we urgeto ensure the attention they require.

In future we can use photo reorganization instead of using heterogeneous database more over High speed, accuracy and non-redundant data are the main advantages of the proposed system. In the proposed system the user is provided with a choice of data screen, which are similar in formats to the source documents. Data entry errors can be minimized through validity checks. After the verification only the data are placed the permanent database. The software can be developed further to include a lot of modules because the proposed system is developed on the view of future, for example we should develop the system as a database independent using so we can connect it to any other database, Now the proposed system is based on PC and intranet but in the future if we need to convert it into internet then we need to change the front end only because we are developing this on the basis of OOP technology and most of the business logic's are bounded in the class files and module like reusable components.
